

# Daily Status Report

Owner: Samuel Stanley

Date: June 24, 2026

## Summary of work completed today:

- Integrated Category-Based Weight Estimation: Attached the product's primary category to cart items client-side ('CartItem' type) and implemented a mapping helper ('SpeedafService.getCategoryWeight') to calculate realistic parcel weights for checkout rate calculation and Speedaf waybill generation instead of using a hardcoded '0.5kg' default.
- Implemented dual-mode Speedaf scan simulator: Built '/scratch/simulate\_speedaf\_scans.ts' to test shipment status flows in development, allowing developers to trigger simulated scans through the live webhook endpoint or directly fallback to updating the database.
- Fixed Speedaf waybill cancellation payload: Wrapped the payload in an array format per the official Speedaf docs to eliminate the syntax parser error ('expect [, actual {').
- Corrected cancellation parameter fields: Mapped 'cancelReason' directly to the actual free-text string (rather than using the numeric code mapping) and added the 'cancelBy' field as expected by the Speedaf endpoint.
- Added client-side & server-side pickup validation: Added a guard in 'cancelWaybillAction' to check the order's status and block cancellations for orders that have already been collected/picked up (status codes  $\geq$  "1" or completed statuses), showing a descriptive user-facing message.
- Refactored database access layers: Decoupled direct Prisma database access from server actions inside the 'delivery' module and centralized database queries into 'DeliveryQueries' to conform to RULE 4 of the NextGen Core Engineering Laws.
- Optimized Speedaf webhook tracking callback: Rewrote the 'api/webhooks/speedaf' webhook route to eliminate obsolete ciphertext decryption code since Speedaf's push callback payload is sent in plain unencrypted JSON.
- Standardized Speedaf tracking queries: Corrected the '/open-api/express/track/query' endpoint request format to wrap the waybill number in the 'mailNoList' array and updated 'getOrderTrackingAction' to read from the official response 'tracks' array rather than incorrect fallback keys.
- Conducted deep documentation analysis and compiled a comprehensive list of 24 technical integration questions, which have been sent to Speedaf's technical team via WhatsApp to coordinate the production switch.
- Verified TypeScript codebase integrity: Executed strict checks ('npx tsc --noEmit') to confirm zero compilation errors.
- Patched Supabase database security: Resolved a critical Supabase security alert by enabling Row-Level Security (RLS) on the Prisma system metadata table '\_prisma\_migrations' in the 'public' schema, ensuring that 100% of tables in the public schema are now secured against unauthorized REST/GraphQL API access.
- Redesigned Platform Control settings UI: Replaced the team directory staff grid card layout with a

structured, responsive, glassmorphism-styled table displaying team member avatars, emails, roles, revenue impact, and sales transaction volumes.

- Filtered customer accounts from Platform Control directory: Added Prisma database query filters in 'UserQueries' ('getAllStaff' and 'getStaffKPIs') to restrict retrieval and counts exclusively to 'ADMIN', 'SUPERADMIN', and 'STAFF' roles, preventing standard 'CUSTOMER' accounts from showing in the directory.
- Fixed settings page dropdown menu crash: Wrapped 'DropdownMenuLabel' and its corresponding options inside 'DropdownMenuGroup' to satisfy Base UI grouping constraints, preventing runtime MenuGroupContext context errors when clicking row action menus.
- Fixed Staff Dialog form pre-population: Introduced a 'useEffect' hook in 'StaffDialog' to dynamically trigger 'form.reset()' with the latest user properties when the editing 'staff' prop changes or the dialog opens, ensuring values are pre-filled instead of showing empty validation errors.

## Detailed notes:

1. Shipping fees and waybill orders now estimate total package weights accurately using a category mapping table (e.g. Shoes: 1.2kg, Shirts: 0.3kg) for storefront checkouts and back-office dispatches.
2. Orders that are physically collected by the Speedaf courier cannot be cancelled via the admin dashboard, protecting against discrepancies with the carrier.
3. The Speedaf webhook endpoint now handles push updates efficiently by bypassing expensive and unnecessary DES decryption attempts.
4. Active terminal checkouts and logistics management screens compile clean and pass validation rules.
5. Enabled Row-Level Security (RLS) on the Prisma migrations metadata table ('\_prisma\_migrations'), securing the final unshielded table in the public schema and satisfying the Supabase periodic security auditor.
6. Updated the settings panel team directory layout from cards to a streamlined table to improve page scannability and structure.
7. Ensured the team directory on the Platform Control settings page only displays internal staff/administrators rather than general storefront customer accounts.
8. Resolved Base UI MenuGroupContext crash on setting directory dropdown options trigger by correctly utilizing DropdownMenuGroup wrapping.
9. Resolved React Hook Form default value caching bug by using active effect resets, ensuring that editing existing staff records pre-populates details successfully.

This report summarizes the complete technical implementation, UI validation updates, and API fixes deployed today for the NextGen Fashion storefront logistics pipeline.
